

TRAVERS HORSE FACILITY

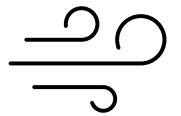

Ventilation system

The system

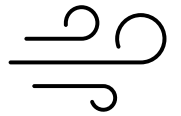

Our apartments are very well isolated and have a heat recovery ventilation system which provides the apartments with fresh air in the bedroom & living room and takes out the used air in the bathroom and kitchen.

The system provides fresh air automatically when:

1. the main bathroom light is switched on to take out the shower damp.
2. the carbon monoxide detector is registering increased level of carbo monoxide, to increase oxygen.
3. the outdoor temperature is over 10 degrees, the room temperature is higher than the set temperature of the heating system, to overcome open windows and that way waste energy.

Manual regulation when cooking

1. Please turn on the extractor hood ventilation
2. Switch the kitchen ventilation switch to level 3 (***)

In case your cooking switches on the fire alarm open the window to ventilate the room extra and inform the facility manager (+31 689971195) that it's a false alarm.

Fire alarm

In case the fire alarm does go off, it goes off in the rest of the block (A or B side), so your neighbors will be alarmed too.

The THF management will be alarmed by the system and they will start a procedure to ensure everyone is safe and switch off the alarm.

In case the alarm keeps going please follow the evacuation plan (see information page).
